The invention relates to an improved magnetic brake assembly and a method of manufacturing the same. The method and brake assembly are used in the cooling of structural components of aircraft engines, such as, for example, a fan case, a bleed duct, and an inlet duct, in order to provide a heat-insulating function as well as to effectively remove heat from the component. Magnetic brakes have been used to provide sufficient braking force for stopping the rotation of fan blades of an aircraft engine. For example, the braking force is provided by magnetically engaging a flat surface of a fan blade with a magnet disposed on a fan case. Typically, the magnet is a permanent magnet and the fan blade is a ferromagnetic material. As a result, the braking force is dependent upon the ferromagnetic material of the fan blade and the magnetic characteristics of the permanent magnet. Therefore, the braking force is dependent upon the type of fan blade used, as well as the material and magnetization of the magnet used to apply the braking force. For example, a fan blade having a magnetically soft material may be able to be braked with a lesser braking force than a fan blade having a magnetically hard material. Furthermore, when fan blades are de-iced, the use of permanent magnets and a flat surface facing the magnet may cause demagnetization of the fan blade, such as due to friction between the magnet and the fan blade. This demagnetization may cause the fan blade to be unable to brake, and may also reduce the amount of braking force applied to the fan blade 82157476af
